Windows API The Windows API allows the AutoCAD application to draw, measure, and edit graphics objects using the functions of the window interface. The API uses graphical objects, pointers, and handle constants to create user interface elements on screen and control the mouse. AutoCAD's basic operations are mainly driven by the Windows API. It can either be used directly from the programming language or as an ActiveX control to interact with the AutoCAD application. 3D features, such as solid modeling, may use custom graphics that are different from standard AutoCAD graphics. These graphics are typically created by the developer by embedding a third-party graphics library in the application. CAD review tools In addition to building and editing objects, the AutoCAD software has several review tools, including a graphical measure tool and the ability to rotate and pan the 3D view. It is possible to select and display parts of the object. The user can place a reference marker on any part of the model and can export the object to other CAD programs. These may include G-Code, G-Tec, MicroStation, and NX. The reviews can be saved in the current drawing or other drawings within the same project. The user can set the red line to be a graphical boundary or an XYZ axis distance. The user can export to DXF or PDF, make imported shapes editable, edit text, and more. Solid modeling The basic operation of solid modeling is similar to that of other CAD programs. Solid modeling is a 3D design feature that requires geometry to be modeled in the form of 2D surfaces. Users can create surfaces by extruding and trimming edges, faces, and volume objects. The surface can be colored, engraved, textured, and have arbitrary 3D shapes, or one may be a cylinder, cone, sphere, etc. A sequence of operations such as planes, faces, edges, faces, surfaces, contours and curved surfaces, can be combined to create a 3D form. The user can alter the 3D geometry, change the 3D surface rendering, and color it. In addition, 3D solids are the basis for 3D printing in the form of stereolithography or selective laser sintering. A 3D object can be defined by a series of parameters that are used to calculate its surface and features. The surface and/or features are displayed in a viewport with visual feedback of the a1d647c40b
