I give the game a A. It's very simple, but it's much more fun than I expected to play. About the only thing to complain about is the loading times are a bit too long. Other than that it's a really well done game. Though it's not as sharp as the Soul series, it certainly is very enjoyable. N/A - Kohime Enbu If you want an action RPG that takes literally no thinking whatsoever, this is probably your game. The actual progression of the game is so simple that it's insanely hard to find faults. N/A - Kohime Enbu It's a simple and fun game to play, at least for people like me who like simple RPGs. What's new:

Heralds that travel in the Lands Between to perform tasks for the Queen are those that are called to serve as the eyes and ears of the Lady, by name, the “elf of visions.” It is the third elf of visions, the very first amongst the Seven Sisters, the elf of visions, who now before you appears as an armless, bloodied, female slave in the thrall of a giant, the “Saguna,” who is now entranced by lustful lust. By the Queen’s decree, if the slayer of the Saguna can become the bride of the Saguna, he will be granted the powers of a Lord of the Elden Ring, a fate that no other has ever attained in the history of the Lands Between.

Many diseases, such as allergies, asthma, and hypersensitivity, are triggered by the regulated over-expression and mislocalization of proteins from allergens. Excess amounts of these proteins have also been linked to conditions such as cardiovascular disease, cancer, autoimmunity, lupus and rheumatoid arthritis and are responsible for the severity of these diseases. Insects, especially flies, are one of the well-known and long-studied models for these processes. Although a conserved pressure has been applied to insect genes since their diversification, most of the obvious allergens have been characterized only recently. Thus, allergy researchers are still exploring the role of insect proteins and the mechanisms of insect sensitization. It has been observed that, in most cases, this over-expression of insect proteins is tightly controlled and linked to the overall structure of the blood meals. As in most living organisms, protein expression from the mosquito *Aedes aegypti*, for example, is controlled by a highly specific and tightly regulated transcription machinery, and the level of the messenger RNA (mRNA) is regulated as it is being translated into proteins in a highly coordinated fashion \[@B1-nutrients-10-01468\]. When a mosquito ingests a blood meal, the salivary glands actively transcribe a large number of genes and produce the appropriate amounts of proteins for digestion. In this complex process, silkmoths (*Bombyx mori*) are able to sense specific peptides from the insect meals and have the capacity to create a worm-like organ inside their head called the proboscis. This organ, known as a gustatory
