Adobe Illustrator_Adobe Illustrator_ is the industry standard for creating vector graphics. It allows you to draw paths and shapes that flow smoothly in any direction, known as _vector_ graphics. Vector graphics are used for posters, logos, and other artistic endeavors. Illustrator provides the tools to convert your images into vector art, as well as adding Photoshop effects to graphics. It supports all popular file formats, including PSD, EPS, PDF, and Adobe JPEG. Like Photoshop, Illustrator also uses a layer-based editing system that enables raster image creation and altering with multiple overlays that support transparency. Illustrator lacks the user interface for the advanced tools in Photoshop, but it does have some unique features, such as stroke tools, that are similar to Photoshop's.

Developing the Child with Mental Retardation. Individuals with mental retardation and related developmental disabilities (MR/DD) are at high risk for developing health problems. The Affordable Care Act expands pediatric health care. The cost of care for MR/DD may increase dramatically as legislation is passed to pay for the uninsured and underinsured. Quality health care will be needed for at least two groups of individuals with MR/DD. First, there will be a group that is at high risk for health problems that providers cannot detect. Second, there will be a group that will need to be consistently observed with health problems that are more easily detected. A new category, developmental delay, will likely be created in the ICD-10 to describe and distinguish developmental problems not acquired due to a diagnosis or syndrome. Development of the coping with deafness scale: validation of a brief measure of problem-focused coping strategies. As part of a larger investigation, a brief measure, the Coping with Deafness Scale, was developed to assess problem-focused coping strategies used by people who are deaf or hard of hearing. The coping with deafness scale was administered to a large convenience sample of deaf and hard of hearing individuals and a subsample of hearing respondents matched for age and gender. The factor analysis conducted on the responses of the deaf sample revealed two distinct factors. The first factor explained 38.22% of the variance and was related to strategies involved in problem solving, the second factor explained 30.35% of the variance and reflected strategies directed at enhancing the quality of life. The deaf sample had lower scores than the matched hearing group on the factor related to problem solving, but they had higher scores on the quality of life strategies. The coping with deafness scale shows promise as a measure of problem-focused coping strategies and is short enough to be used in a large epidemiological study.
