the issue with this approach is that it does not allow the user to move the antialiased depth map on the canvas. this makes the plugin very difficult to use at times, especially when the antialiasing needs to be calibrated for the best results. it is clear that for better results, dof pro needs antialiasing at multiple levels. we have developed a special blending mode that causes the depth of field to produce a darker contrast at the edges for antialiasing. many who have tried dof pro have found it difficult to get good results at

the edges. when antialiasing is turned off, however, the edge quality improves and is very forgiving. with dof pro, you can set antialiasing parameters to exclude the edges from the depth of field output and only apply antialiasing for your focus mask. this produces best quality while maintaining an excellent depth of field effect. although it is capable of perfect depth of field effects, dof pro can be used for more than just blur effects. dof pro contains multiple filters that can be used to blend between two images of different depths of field. this makes it possible to blend in between two images while producing perfect depth of field. this is one of the most powerful features of dof pro. the optimum settings for image blending will require some

experimentation and a lot of experimentation. currently, we have included standard blend modes for lighten/darken, multiply/divide, and screen. dof pro includes a variety of customizable settings to aid users in getting the most out of the plugin. for instance, you can adjust the blending mode settings to your liking. you can also use the lighten/darken blending mode setting to produce more believable results. also, you can adjust the shift nudge to determine how far the blur is allowed to go for no shift to simulate your subject actually being at your focal distance.
