I started iTunes and did not see an update to the iTunes Store. I checked the Mac App Store and did see a new update. So it downloaded the new version but did not update to the new version. My bet would be that it does not bother to check if the Store is up to date when updating. If you're lucky, your buddy just uploaded it to a Torrent site and you're the first person to download it. If you're not so lucky, you'll want to be connected to your ISP's network in order to complete the download. Next, you'll use a shared folder or network share and, yes, some torrent clients do a better job of this than others. The Mac OS X release, Mac OS X Mountain Lion, was an update to the Mac OS X Snow Leopard. Mountain Lion was Apple's first release of a major version change since Mac OS X Leopard. Mountain Lion adds support for three-monitor configuration, multi-touch gestures, and is built using the iCloud public cloud service. With Mountain Lion in addition to the options introduced in Snow Leopard, the Mac OS X user experience continues to improve. Some features included in Snow Leopard continue to be available to Mac OS X users. The chief difference in Mountain Lion is the addition of the iCloud, a default service built into Mac OS X. Sleeping on new software is a perfectly natural thing to do, even if you install new software all the time, and I've always hated the idea of downloading a torrent in the middle of the night. There's a solution for this if you're so inclined. The torrent can be continued when it's almost finished, so you can tell the app to stop downloading and continue later. The Mac OS X Server's App Store can also download updates after you've set up your server. On the Mac OS X Mountain Lion download, Apple offered two options for handling the update: To download the full installer program, or to download the update via software update. In the first scenario, the Torrents: Mac OS X Server: Update will be downloaded and run.
